TRAINER KEY. DO NOT DISTRIBUTE. Day 1, Session 3: Did the programme make the difference?

Day 1, Session 3: Did the programme make the difference?

Underlined = claim the source supports. ~~Struck out~~ = claim the source does not support. Green boxes = model answers (accept equivalent wording).

Source: the pilot trial (a lottery assigned 400 businesses to join or wait; about half joined; costs compared 12 months later): -1,014 AED, interval -1,167 to -862, $p < 0.001$. Rule: annual saving of at least 1,000 AED per business; negative means lower costs. Accept differing provisional decisions with evidence and clear limits.

Worksheet (2 pages)

1 Name the comparison

> Businesses randomly assigned by lottery to join GreenWaste compared with businesses assigned to wait (the control group), on annual waste management cost 12 months later, in one pilot district. Random assignment makes the groups alike on average before the programme.

2 Read the estimate and interval. State the saving and explain whether it settles the decision rule.

> The estimated saving is 1,014 AED per business per year (coefficient -1,014), 95% interval 862 to 1,167 AED. The point estimate is above 1,000 but the interval spans 1,000, so the rule is not settled. Evidence of some saving is not the same as certainty that the saving is at least 1,000. Programme costs are not supplied.

3 How far does this result reach? What would you need to know before using the pilot for the whole city?

> One district, eligible businesses (scores 58 or below), 12 months. Ask how similar the city's businesses and delivery conditions are to the pilot; follow-up, take-up and whether assignment stayed random; programme costs; whether savings last.

Write a decision note (3 or 4 sentences with a partner)

> Example: "A pilot lottery in one district estimated an annual saving of 1,014 AED per business after 12 months (interval 862 to 1,167). Because the interval spans our 1,000 AED rule and covers one district, I would recommend a limited next phase with evaluation rather than city-wide rollout. We still need programme costs and evidence on how the intended businesses differ from the pilot." Accept different provisional decisions with source evidence and limits.

Check an illustrative AI draft (mark each unsupported conclusion; rewrite using the result sheet)

> "The pilot trial estimated an annual saving of 1,014 AED per business. ~~The trial proves the minimum saving is met.~~ ~~Nationwide rollout is good value for money.~~"

Rewrite

> Example: "The pilot estimated a saving of 1,014 AED per business (interval 862 to 1,167). Because the interval includes values below 1,000, the minimum saving is not established. The pilot covers one district and no programme costs are supplied, so it does not show nationwide value for money."

Your question from memory (work alone)

> Example: "How do the pilot businesses differ from the businesses expansion would cover?" If very different, I would not extend the pilot result and would recommend a further phase. Accept any specific question and a stated effect on the recommendation.

AI exercise: advice for the minister (about 7 minutes)

Source for checking: the pilot trial result, rule and the improved prompt facts (400 businesses, 200/200, one district; reduction 1,014, interval 862 to 1,167; full programme costs and results elsewhere not supplied).

Prepared response (for participants not using Copilot)

> Before making a recommendation, I would ask which businesses and delivery conditions the proposed expansion would cover, what programme costs it would incur, and how the authority wants to handle uncertainty around our rule of at least a 1,000 AED reduction.
>
> The pilot trial reports a randomised comparison among eligible businesses in one pilot district: annual waste management cost after twelve months was about 1,014 AED lower in the treatment group than in the control group, with a 95% interval for the reduction of 862 to 1,167 AED. A limited next stage with evaluation is a defensible option, subject to the authority's costs and risk tolerance, because the interval includes reductions below our rule of at least 1,000 AED. Before broader approval, request evidence on delivery costs and on how the intended businesses differ from this pilot. The pilot alone does not show national effects or value for money.

(a) Which clarifying question in the response helps most?

> Example: which businesses and delivery conditions expansion would cover (it decides whether the pilot result applies). Accept any with a reason.

(b) Does the advice separate some reduction in cost, the rule, wider reach and full programme costs?

> Yes: the reduction (1,014, interval 862 to 1,167), the rule (the interval includes values below 1,000), wider reach (one district) and full costs (request delivery costs; no value-for-money claim).

(c) Which claim would you check or strengthen before sharing this advice?

> Example: check "randomised comparison among eligible businesses in one pilot district" and the numbers against the pilot result; strengthen "limited next stage" by naming the evaluation plan and the condition that would trigger wider approval.
