AI: keep your judgement in charge

Smooth writing can hide mistakes. **You remain responsible for the work you share.** Keep this card for the week's Microsoft Copilot exercises.

Give a clear prompt

State your role, task, source and preferred format. Include the decision rule and the study's limits. Ask for missing information before conclusions. Revise the prompt when the answer misses your purpose.

Ask for a fresh review

Start a new chat and provide the source, your prompt and the response. Ask for a sceptical evaluation review. A fresh review may spot problems; agreement between two answers does not establish correctness.

Check it yourself

Check every number and claim against the source. Does the comparison support the conclusion? Does the interval mean what the response says? What is missing? Fluent wording is not evidence.

Ask a colleague

Ask someone to check the reasoning and important omissions. Give them the source as well as the response. Correct problems before sharing the work.

Try: role, task, context, format

> I am a policy adviser deciding whether to expand a business waste programme. I need to understand what this evaluation result supports. I have pasted the results table. Our decision rule is a reduction in annual waste management cost of at least 1,000 AED per business per year. The study compares the same businesses before and after. Ask me questions before you answer. Then give three short points: what the result shows, what it does not show, and one question for the evaluator.

Avoid steering the answer: "recommend expansion" invites a conclusion before the evidence has been checked. Ask which claims are supported and what could change the advice.
