Page 1 | Comparison, assumptions and data

1. Who was compared, and how were they chosen?

Worked request: Send the assignment/recruitment protocol, the population studied and the businesses intended for expansion. I would check whether the comparison is credible and whether its result can guide the proposed delivery setting.

Follow-up: If delivery or population changes, which feature might change the result, and how could the next phase test it?

My evidence request and decision purpose:

---

2. What supports a claim of cause?

Worked request for city DiD: Send several earlier cost measures for both groups and a record of other changes affecting them. I would assess whether a parallel-trends counterfactual is plausible; conflicting trends would weaken reliance on the estimate.

Follow-up: If earlier data are absent, which alternative comparison or prospective design would reduce the decision uncertainty? Similar earlier trends alone would not prove the assumption.

My evidence request and decision purpose:

---

3. Where do data come from, and who is missing?

Worked request: Send recruitment and follow-up counts by group, reasons for missing outcomes and the measurement-validation process. I would check whether missingness or measurement could distort the comparison.

Follow-up: Does the conclusion change under plausible assumptions about unavailable outcomes? A complete supplied file does not by itself answer this.

My evidence request and decision purpose:

Use examples to frame your own request, not to imply that checks have been done. In the GreenWaste training case, source cards E1/E2, E4-E6 and E7 address these families.

Page 2 | Uncertainty and the recommendation

4. What are the estimate, interval and decision rule?

Worked request: Show the planned decision-relevant estimate and its interval next to the 1,000 AED saving rule, with population, period and units. I would distinguish a positive reduction from a settled minimum-saving claim.

Follow-up: If the interval spans the rule, what risk is acceptable and what further evidence could change the action? Statistical significance alone does not decide this.

My evidence request and decision purpose:

---

5. Does the recommendation go beyond the evidence?

Worked request: Send the intended expansion population, delivery conditions, full cost boundary and evidence for how long benefits last. I would compare those with the study and the assumed model before endorsing national spending.

Follow-up: Which unverified input could reverse the advice under plausible settings, and what evidence could resolve it?

My evidence request and decision purpose:

After the answer

Rate **Supported / Partial / Unanswered** against your actual request. Cite the source, identify what is still absent and choose a follow-up or action.

The source I would use and the remaining question:

Using AI to help

Provide only authorised, non-sensitive sources. State the decision, units, population and rule; ask for clarifying questions and source IDs. Check facts and omissions yourself. Do not let fluent advice create missing evidence.

Fictional GreenWaste examples: E3 addresses the rule; E1/E2 and E8 address reach and economic advice. This optional desk reference does not replace the clinic answer log or independent reading assessment.
