Trainer key | Analyst clinic

Setup and release order

Give H9 pages 1–5 first. Hold evidence cards E1–E8 until a relevant question is asked. Answer from the supplied source, name its limit, then show the ID. If a check is absent, say so; do not invent a clean audit. With eight groups, use roughly three minutes each for a question, answer and follow-up, then six minutes for the largest unresolved gap. Learners log two substantial exchanges on page 4. Give the four-page evidence pack after the clinic.

What the draft note gets wrong

N1: The pilot point estimate is about 1,014 AED, but its interval of 862–1,167 AED spans the separate 1,000 AED minimum rule.
N2: The three city methods use the same 10,000-business file and different comparisons. Their positive direction is useful, but they are not independent replications of a national effect.
N3: The 2.44 benefit–cost ratio revisits the RCT-linked partial model from Session 1. It assumes 1,800 AED delivery cost, equal annual savings in years 1–5 and a 5% rate. These are not measured national returns or complete costs.

Judge answers against questions

E3 answers the pilot interval question but not national reach. E4 honestly says earlier trends are unavailable. E5 gives a concrete pre-programme comparability concern near the cut-off. E6 gives reuse and residual gaps, not a full support or selection check. E7 cannot establish real-world fieldwork quality from a complete synthetic file. E8 identifies assumptions, not verified long-run savings.

Accept a bounded next phase with specified evaluation and cost monitoring, or a request for further evidence, when the participant cites a source, states its boundary and names an accountable next step. A decision may remain unchanged while its justification improves. Collect the independent recommendation before offering the optional Copilot extension.

Optional 15-minute extension

The supplied AI answer contains useful early observations. Its later assurances about independent studies, national savings and data reliability are unsupported. Stage 1 (8 minutes) is source-based markup; Stage 2 (7 minutes) uses the improved prompt or prepared paper alternative. Do not treat either response as new evidence.
